MODULE 017 / 100 • STATISTICS & PROBABILITY

Hypothesis Testing and p Values

Overview: Null hypothesis, t-tests, ANOVA, Chi-Square, p-values, and Type I/II errors.

1. Fundamental Architecture & Theoretical Principles

In machine learning engineering and production data science, mastering **Hypothesis Testing and p Values** is paramount to designing robust, reproducible, and scalable intelligence systems. This topic anchors foundational understanding across analytical theory, algebraic formulations, and practical implementation.

Component / Dimension	Technical Specification & Best Practice
Core Formulation	Governing mechanisms and operational dynamics of Hypothesis Testing and p Values.
Production Risk	Data leakage, numerical instability, excessive latency, or distribution drift.
Standard Remedy	Robust validation splits, automated testing, regularized optimization, and monitoring.
Primary Frameworks	PyTorch, Scikit-Learn, Ray, Hugging Face, MLflow, Docker, FastAPI.

2. Engineering Guidelines & Implementation Roadmap

- **Baseline Verification:** Formulate measurable benchmarks and unit tests prior to deployment.
- **Reproducibility:** Pin seed states, containerize runtime environments, and version artifacts.
- **Monitoring:** Instrument low-overhead telemetry to track inference latencies and data quality.
- **Edge Case Containment:** Handle null inputs, out-of-distribution values, and catastrophic drops.

3. Competency Checklist & Production Readiness

[ ] Theoretical mastery of mathematical foundations and algorithms for Hypothesis Testing and p Values.

[ ] Pipeline implementation with leak-free preprocessing and cross-validation.

[ ] Benchmarking evaluation completed against industry standard baselines.

[ ] Production deployment artifacts packaged with automated tests.
