MODULE 099 / 100 • AI SECURITY & SAFETY

Security and Vulnerability in AI OWASP Top 10

Overview: Prompt injection, data poisoning, adversarial perturbations, model extraction.

1. Fundamental Architecture & Theoretical Principles

In machine learning engineering and production data science, mastering **Security and Vulnerability in AI OWASP Top 10** is paramount to designing robust, reproducible, and scalable intelligence systems. This topic anchors foundational understanding across analytical theory, algebraic formulations, and practical implementation.

Component / Dimension	Technical Specification & Best Practice
Core Formulation	Governing mechanisms and operational dynamics of Security and Vulnerability in AI OWASP Top 10.
Production Risk	Data leakage, numerical instability, excessive latency, or distribution drift.
Standard Remedy	Robust validation splits, automated testing, regularized optimization, and monitoring.
Primary Frameworks	PyTorch, Scikit-Learn, Ray, Hugging Face, MLflow, Docker, FastAPI.

2. Engineering Guidelines & Implementation Roadmap

- **Baseline Verification:** Formulate measurable benchmarks and unit tests prior to deployment.
- **Reproducibility:** Pin seed states, containerize runtime environments, and version artifacts.
- **Monitoring:** Instrument low-overhead telemetry to track inference latencies and data quality.
- **Edge Case Containment:** Handle null inputs, out-of-distribution values, and catastrophic drops.

3. Competency Checklist & Production Readiness

[ ] Theoretical mastery of mathematical foundations and algorithms for Security and Vulnerability in AI OWASP Top 10.

[ ] Pipeline implementation with leak-free preprocessing and cross-validation.

[ ] Benchmarking evaluation completed against industry standard baselines.

[ ] Production deployment artifacts packaged with automated tests.
